

Problem Statement

Project: ANOM AI - Let's Connect Agent

Problem Statement

Many people struggle to build meaningful connections because existing social platforms focus on endless scrolling rather than genuine interactions. Users often find it difficult to discover compatible people, start conversations, plan safe meetups, and maintain meaningful relationships.

Objective

Develop ANOM AI, an AI-powered social networking platform that helps users discover compatible people, analyze profile compatibility, generate conversation starters, schedule meetings, receive intelligent venue suggestions, and communicate in a safe environment using IBM Cloud AI services.

Proposed Solution

ANOM AI combines user profiles, interests, IBM watsonx.ai personality analysis, compatibility scoring, AI conversation starters, meeting planning, notifications, and Cloudant storage into a single platform. The system recommends meaningful connections instead of random matches and provides smart assistance throughout the interaction journey.

Key Features User authentication and profiles AI personality analysis Interest matching and compatibility score AI conversation starters Meeting scheduler with venue suggestions Notifications and dashboard analytics Cloudant database integration **IBM Cloud Services Used** IBM watsonx.ai IBM Cloudant NoSQL Database IBM Cloud Object Storage **Expected Outcome**

A deployment-ready AI networking platform that encourages genuine relationships, improves communication, and demonstrates practical use of IBM Cloud technologies.
